*TDH data (includes unknown and unspecified school district births)

Table 5: Birth *Rates* to Females 15 to 17 by School District 1998-2001

School District	1998	1999	2000	2000 with Census Data	2001
Alamo Heights	13.9	8.0	20.9	17.8	26.0
East Central	45.2	41.5	34.2	33.9	30.5
Edgewood	120.9	127.9	117.1	85.1	92.8
Ft. Sam Houston	0.0	0.0	0.0	0.0	0.0
Harlendale	87	90.0	78.8	67.9	70.0
Judson	25.8	29.3	33.1	30.3	27.1
Lackland AFB	0.0	19.2	0.0	0.0	0.0
Northeast	27.7	29.5	31.6	29.7	26.9
Northside	37.2	29.0	32.2	28.7	37.5
Randolph Field	8.6	0.0	8.5	13.2	0.0
San Antonio	100.4	104.1	103.9	77.9	101.6
Somerset	59.1	55.0	35.2	40.0	51.4
Antonio	96.9	92.1	80.8	67.3	75.8
Southside	62.8	67.4	38.7	41.2	80.9
Southwest	81.8	81.1	88.9	70.7	85.3
Bexar County Total*	51.1	50.2	49.3	49.3	44.5

*TDH data (includes unknown and unspecified school district births)

Rate of births by school district is calculated by using birth certificate data to identify all births to mothers age 15 to 17 in the school district catchment area. Estimates of the female population of each school district are derived from Texas Education Association (TEA) data on grade enrollment. This method is likely to overestimate birth rates because girls not enrolled in public schools are represented in the numerator, but left out of the denominator in the calculation. This method is limited for this reason, but is used because it is the most accurate that is available in non-census years.

In the year 2000, actual census data were available. Birth rates for each school district were recalculated using data from the census for the 15–17 year old female population. These rates should be considered more accurate than those calculated without using census data. As can be seen in this table, the TEA-population-estimate method yields an overestimate of birth rates in most, but not all, cases.
